

Appl. No. 09/473,575

Amdt. dated April 7, 2004

Reply to Office Action of February 12, 2004

Amendments to the Claims:

This listing of claims will replace all prior versions, and listings, of claims in the application:

Listing of Claims:

1-61. (Cancelled)

62. (currently amended):

A processor comprising:

an instruction delivery engine to store and fetch instructions to be executed by the processor from one or more a plurality of threads based upon a current processing mode; and

an allocator to receive instructions from the instruction delivery engine and to perform allocation in a processor resource required for the execution of the instructions based upon the current processing mode.

63. (currently amended):

The processor of claim 62 wherein the allocator assigns all of the entire processor resource to the thread a one of the plurality of threads that is active if the current processing mode is single threading, and the allocator assigns a portion of the processor resource to each of the plurality of threads running concurrently if the current processing mode is multithreading.

64. (cancelled)

65. (currently amended):

The processor of claim 63 wherein:

if the current processing mode is single threading, the allocator allocates an amount of entries for the instructions from the active thread one of the plurality of threads in the processor resource if the processor resource has sufficient available entries and wherein the allocator activates at least one stall signal if the processor resource does not have sufficient available entries; and,

if the current processing mode is multithreading, the allocator allocates an amount of entries for the instructions from each respective thread in the a respective portion of the processor resource if the respective portion has sufficient available entries and wherein the allocator activates at least one stall signal if the respective portion does not have sufficient available entries.

66. (cancelled)

67. (previously presented):

The processor of claim 65 wherein the instruction delivery engine uses the at least one stall signal to perform its corresponding function.

68. (currently amended):

The processor of claim 67 wherein the instruction delivery engine re-fetches the stalled instructions in the respective thread to the allocator if the at least one stall signal is activated.

69. (original):

The processor of claim 67 wherein the instruction delivery engine fetches a subsequent instruction from another thread to the allocator if the at least one stall signal for the respective thread is activated and said another thread is not stalled.

70. (original):

The processor of claim 67 wherein the instruction delivery engine fetches an invalid instruction to the allocator if the stall signal for the respective thread is activated.

71-83. (Cancelled)

84. (currently amended):

A method for allocating processor resources by a processor, the method comprising:

fetching instructions to be executed by the processor from one or more threads based upon a current processing mode; and,

performing allocation in a processor resource required for the execution of the instructions based upon the current processing mode.

85. (currently amended):

The method of claim 84 further comprising:

assigning all of the entire-processor resource to the thread-a one of the plurality of threads that is active if the current processing mode is single threading, and,

assigning a portion of the processor resource to each of the plurality of threads running concurrently if the current processing mode is multithreading.

86. (currently amended):

The method of claim 85 wherein:

if the current processing mode is single threading,

allocating an amount of entries for the instructions from the active thread-one of the plurality of threads in the processor resource if the processor resource has sufficient available entries, and

Appl. No. 09/473,575

Reply to Office Action of February 12, 2004

activating at least one stall signal if the processor resource does not have sufficient available entries; and,

if the current processing mode is multithreading,

allocating an amount of entries for the instructions from each respective thread in the a respective portion of the processor resource if the respective portion has sufficient available entries, and

activating at least one stall signal if the respective portion does not have sufficient available entries.

87. (previously presented):

The method of claim 86 further comprising using the at least one stall signal to perform corresponding functions by the instruction delivery engine.

88. (currently amended):

The method of claim 87 further comprising re-fetching the stalled instructions in the respective thread to the allocator if the at least one stall signal is activated.

89. (previously presented):

The method of claim 87 further comprising fetching a subsequent instruction from another thread to the allocator if the at least one stall signal for the respective thread is activated and said another thread is not stalled.

90. (previously presented):

The method of claim 87 further comprising fetching an invalid instruction to the allocator if the stall signal for the respective thread is activated.

91. (currently amended):

A processor comprising:

means for fetching instructions to be executed by the processor from one or more threads based upon a current processing mode; and,

means for performing allocation in a processor resource required for the execution of the instructions based upon the current processing mode.

92. (currently amended):

The processor of claim 91 further comprising:

means for assigning all of the entire processor resource to the thread a one of the plurality of threads that is active if the current processing mode is single threading, and,

means for assigning a portion of the processor resource to each of the plurality of threads running concurrently if the current processing mode is multithreading.

Reply to Office Action of February 12, 2004

93. (currently amended):

The processor of claim 92 wherein:

means that are operative if the current processing mode is single threading for allocating an amount of entries for the instructions from the ~~active thread~~ one of the plurality of threads in the processor resource if the processor resource has sufficient available entries, and activating at least one stall signal if the processor resource does not have sufficient available entries; and,

means that are operative if the current processing mode is multithreading for allocating an amount of entries for the instructions from each respective thread in ~~the~~ a respective portion of the processor resource if the respective portion has sufficient available entries, and activating at least one stall signal if the respective portion does not have sufficient available entries.

94. (previously presented):

The processor of claim 93 further comprising means for using the at least one stall signal to perform corresponding functions by the instruction delivery engine.

95. (currently amended):

The processor of claim 94 further comprising means for re-fetching the stalled instructions in the respective thread to the allocator if the at least one stall signal is activated.

96. (previously presented):

The processor of claim 94 further comprising means for fetching a subsequent instruction from another thread to the allocator if the at least one stall signal for the respective thread is activated and said another thread is not stalled.

97. (previously presented):

The processor of claim 94 further comprising means for fetching an invalid instruction to the allocator if the stall signal for the respective thread is activated.
